

PRODUCT INFORMATION

C-Flag Tag Tag

Target CXB2

BAPS, CX26, DFNA3, DFNA3A, DFNB1, DFNB1A, **Synonyms**

HID, KID, NSRD1, PPK

Human CXB2 full length protein-synthetic Description

nanodisc 6~8weeks

Delivery Uniprot ID P29033 HFK293 **Expression Host**

Protein Families Ion Channels: Other

Protein Pathways

Formulation & Reconstitution

Background

The human full length CXB2 protein has a MW of **Molecular Weight**

Lyophilized from nanodisc solubilization buffer (20 mM Tris-HCl, 150 mM NaCl, pH 8.0). Normally 5% – 8% trehalose is added as protectants before lyophilization. Please see Certificate of Analysis for specific instructions. Do not use solvents with

a pH below 6.5 or those containing high concentrations of divalent metal ions (greater than 5 mM) in subsequent experiments. Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not

intended for use within a month, aliquot and store Storage & Shipping at -80°C (Avoid repeated freezing and thawing). Lyophilized proteins are shipped at ambient

temperature.

This gene encodes a member of the gap junction protein family. The gap junctions were first characterized by electron microscopy as regionally specialized structures on plasma membranes of contacting adherent cells. These structures were shown to consist of cell-to-cell channels that facilitate the transfer of ions and small molecules between cells. The gap junction

proteins, also known as connexins, purified from fractions of enriched gap junctions from different tissues differ. According to sequence similarities at the nucleotide and amino acid levels, the gap junction proteins are divided into two categories, alpha and beta. Mutations in this gene are responsible for as much as 50% of pre-lingual, recessive deafness. [provided by RefSeq, Oct
