

## **PRODUCT INFORMATION**

Tag C-Flag Tag **Target** OR2S2

OR37A, OST715 **Synonyms** 

Human OR2S2 full length protein-synthetic Description

nanodisc **Delivery** 6~8weeks **Uniprot ID** Q9NQN1 **Expression Host HEK293** 

Storage & Shipping

Transmembrane, Druggable Genome, **Protein Families** 

**Protein Pathways** GPCRDB Class A Rhodopsin-like,

The human full length OR2S2 protein has a MW of **Molecular Weight** 

35.2kDa Lyophilized from nanodisc solubilization buffer (20

mM Tris-HCl, 150 mM NaCl, pH 8.0). Normally 5% – 8% trehalose is added as protectants before lyophilization. Please see Certificate of Analysis Formulation & Reconstitution

for specific instructions. Do not use solvents with a pH below 6.5 or those containing high

concentrations of divalent metal ions (greater than 5 mM) in subsequent experiments. Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not intended for use within a month, aliquot and store

at -80°C (Avoid repeated freezing and thawing). Lyophilized proteins are shipped at ambient

témperature.

Olfactory receptors interact with odorant molecules in the nose, to initiate a neuronal response that triggers the perception of a smell. The olfactory receptor proteins are members of a large family of G-protein-coupled receptors (GPCR) arising from single coding-exon genes. Olfactory receptors share a 7-transmembrane domain structure with many neurotransmitter and hormone receptors and are responsible for the

recognition and G protein-mediated transduction of odorant signals. The olfactory receptor gene family is the largest in the genome. The nomenclature assigned to the olfactory receptor **Background** 

genes and proteins for this organism is

independent of other organisms. This olfactory receptor gene is a segregating pseudogene, where some individuals have an allele that encodes a functional olfactory receptor, while other individuals have an allele encoding a protein that is predicted to be non-functional.
